**TRAFFIC AND PARKING STUDY  
Washingtonville Neighborhood  
Village of Mamaroneck, New York**

**1.0 INTRODUCTION**

Provident Design Engineering (PDE) has been retained by the Village of Mamaroneck to review the traffic circulation and the parking conditions for the Washingtonville Neighborhood in the Village (see Figure No. 1). The Washingtonville Neighborhood is an older densely populated neighborhood with narrow streets. Some of the properties do not have their own driveways while many have very limited off-street parking available, thus there is a high demand for on-street parking in the neighborhood. While the streets appear as generally quiet residential neighborhood streets, because of the location of the neighborhood, there are a significant number of vehicles using the streets as cut-thru's. This decreases pedestrian and bicycle safety. There are sidewalks in the neighborhood but residents cross the streets to get to their vehicles and children walk to school and the commercial facilities. Likely due to the narrow streets and on-street parking, along with the cut-thru's, there were limited bicyclists observed in the neighborhood.

The Washingtonville neighborhood was originally constructed in the mid 1800's, and thus was not designed to support the amount of automobiles traveling and parking in the neighborhood. Between its densely developed area and its layout, options to improve traffic and parking in the neighborhood are limited.

One of the concerns of the Village and the residents of the neighborhood is vehicles cutting through the area. Drivers will cut through the neighborhood to avoid traffic delays and traffic signals along Mamaroneck Avenue, Palmer Avenue and Fenimore Road. Based upon traffic counts and field observations, the cut-thru's occurred throughout the day and night. More vehicles appear to cut through in the Peak AM Hour (7:30 – 8:30 AM) than in the Peak PM Hour (4:45 – 5:45 PM). During the Peak AM Hour alone, approximately 500-550 vehicles are possibly cutting through the neighborhood from the west (Fenimore Road). Another 250-300 or so are possibly cutting through in the opposite direction during the same Peak AM Hour. There is the desire to shift this traffic out of the neighborhood and onto roads such as Hoyt Avenue.

The study area consists of 13 traffic study locations and 9 streets. To perform this Study, PDE performed various observations of the traffic operations in the neighborhood. PDE also conducted traffic counts and parking counts throughout the months of September and October.

There are currently approximately 158 on-street parking spaces provided in the

Figure No. 01

neighborhood (excluding parking spaces on Pelham Street, Ailing Street, Old White Plains Road, Mamaroneck Avenue, and Hoyt Avenue), which may vary slightly based on the size of the parked vehicles and the ways some vehicles park. These vehicles have to parallel park on the various streets in the neighborhood and are supposed to comply with the parking restrictions applied by the Village of Mamaroneck. These restrictions only allow non-residents to park on these streets for 2 hours, while residents with permit stickers are allowed to park in the neighborhood without any restrictions in legal parking spaces. The main purpose of this is to limit commuter and shopper parking in the neighborhood.

PDE held discussions with representatives of the Village including the Police Department. To perform this Study, Provident Design Engineering performed various observations of the traffic operations at the various locations in the neighborhood, as well as conducted parking counts at various times during the day and week. PDE performed traffic counts and analysis for the following intersections as required by the Village:

1. Fenimore Road & Hoyt Avenue
2. Mamaroneck Avenue & Hoyt Avenue
3. Fenimore Road & Waverly Avenue
4. Plaza Avenue & Waverly Avenue
5. Mamaroneck Avenue & Waverly Avenue
6. Plaza Avenue & Center Avenue
7. Old White Plains Road/Mamaroneck Avenue & Center Avenue
8. Plaza Avenue & Madison Street
9. Old White Plains Road & Madison Street
10. Plaza Avenue & Washington Street
11. Old White Plains Road & Washington Street
12. Plaza Avenue & Grand Street
13. Old White Plains Road & Grand Street

Pelham Street and Ailing Street are also part of the Washingtonville Neighborhood and the traffic volumes for those streets are accounted for in the traffic counts described above. Hoyt Avenue is not part of the neighborhood but was included due to its potential impacts resulting from possible mitigation measures within the neighborhood as well as some issues regarding its intersection with Fenimore Road (which also is not part of the neighborhood). Hoyt Avenue is essentially an industrial road and has a signalized intersection with Mamaroneck Avenue. At the other end, Hoyt Avenue has an unsignalized intersection with Fenimore Road, with Stop signs facing the Hoyt Avenue approach and the Fenimore Road westbound approach, but not the Fenimore Road eastbound approach. This is discussed in more detail in Section 5. Hoyt Avenue is wider and has the capacity to support more traffic which could reduce the amount of traffic traveling through the Washingtonville Neighborhood.

While almost entirely residential, there are some non-residential properties at the end of the neighborhood near Old White Plains Road/Mamaroneck Avenue including a Church, a day care center and some commercial facilities.

The Village has been reviewing this area over the years and changes have been implemented. A previous Study for this area was commissioned by the Village in 2000-2001. To increase the traffic on Hoyt Avenue, the Village modified the traffic control and added a Stop sign on Fenimore Road. There has been an increase in traffic on Hoyt Avenue. To reduce the number of train commuters parking in the neighborhood, the Village installed a resident-parking permit plan. Modifications were made to the intersections of Mamaroneck Avenue and Old White Plains Road as well as Old White Plains Road and Center Avenue. Truck restrictions were also added over the years.

The following is a summary of PDE's observations and findings in regard to existing and future traffic operations and parking.

*It is important to consider that any modification will have positive and negative impacts so one area or street may be improved at the expense of another area or street. Traffic will find an alternative route and that if you limit traffic in one spot, it will increase traffic in another. Also, any turn restrictions or traffic calming will not only impact the drivers cutting through the neighborhood but will also impact the residents, and thus a balance must be struck.*

## 2.0 **TRAFFIC CONDITIONS**

### Existing Traffic Volumes

PDE performed numerous observations throughout the area along with specific traffic counts at the subject intersections. The traffic counts were performed during the peak commuter periods at each of the locations on various weekdays in the month of September of 2016 when schools were open. The counts were performed during both the AM and PM peak periods at each location.

PDE conducted traffic counts at the following intersections in the Study Area, as required by the Village:

1. Fenimore Road & Hoyt Avenue
2. Mamaroneck Avenue & Hoyt Avenue
3. Fenimore Road & Waverly Avenue
4. Plaza Avenue & Waverly Avenue
5. Mamaroneck Avenue & Waverly Avenue
6. Plaza Avenue & Center Avenue
7. Old White Plains Road/Mamaroneck Avenue & Center Avenue
8. Plaza Avenue & Madison Street
9. Old White Plains Road & Madison Street
10. Plaza Avenue & Washington Street
11. Old White Plains Road & Washington Street
12. Plaza Avenue & Grand Street
13. Old White Plains Road & Grand Street

The roadways listed above are all under local jurisdiction except for Mamaroneck Avenue, which is under the jurisdiction of Westchester County.

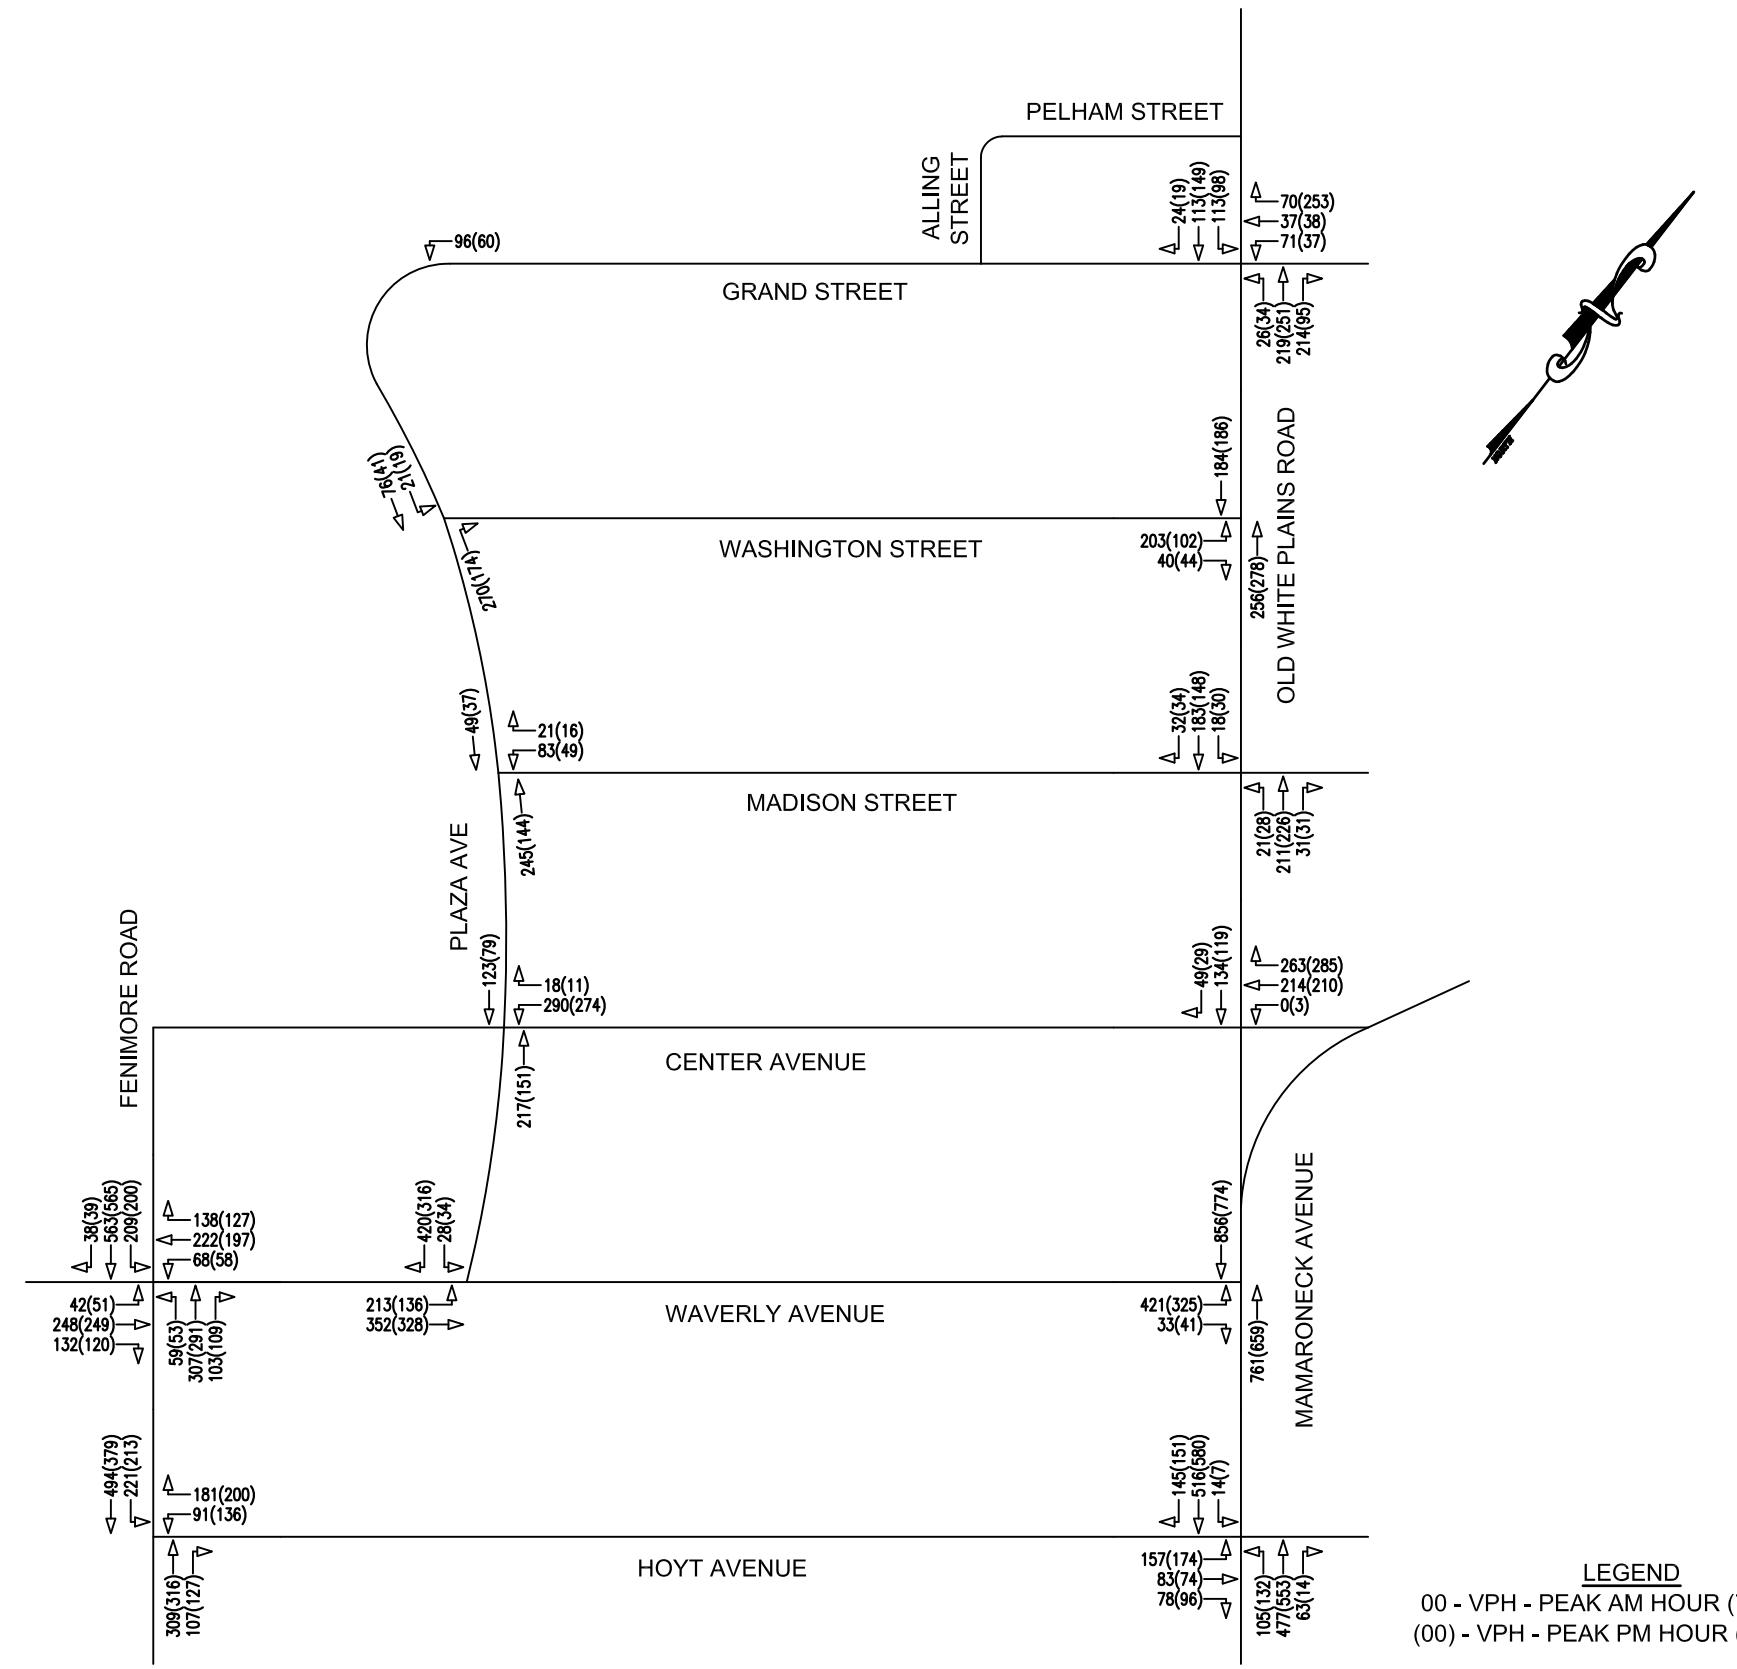

The traffic counts for the above intersections were summarized to determine the Peak Roadway Hours. Based upon this review, it was determined that the Peak Weekday Roadway Hours were:

Peak Weekday AM Hour: 7:30 AM to 8:30 AM

Peak Weekday PM Hour: 4:45 PM to 5:45 PM

The traffic volumes summarized for the two peak hours were generally left unbalanced due to the various properties and driveways in between. The 2016 Existing Weekday AM and PM Traffic Volumes are illustrated on Figure No. 2.

The existing traffic volumes were compared to the traffic volumes from 2000 and 2001.

During the Peak AM Hour, the current volumes on Fenimore Road are about 10% higher eastbound/southbound but about 15% lower westbound/northbound. Within the Washingtonville Neighborhood, there is currently less traffic utilizing Waverly Avenue and Washington Street (though only slightly less) as well as on northbound Old White Plains Road and on Mamaroneck Avenue, but more traffic on Hoyt Avenue (in both directions), Center Avenue, Madison Street, and Grand Street as well as southbound Old White Plains Road. During the Peak PM Hour, the current volumes on Fenimore Road are significantly higher eastbound/southbound but significantly lower westbound/northbound. Within the Washingtonville Neighborhood, there is currently less traffic utilizing Waverly Avenue, Center Avenue, and Grand Street but more traffic on Hoyt Avenue (in both directions), Madison Street (slightly) and on Old White Plains northbound as well as on Mamaroneck Avenue. Old White Plains Road (southbound) and Washington Avenue have similar traffic volumes compared to the earlier counts.

Thus, during the Peak AM Hour, there appears to be less vehicles currently cutting through the neighborhood eastbound (toward Mamaroneck Avenue) while more vehicles are cutting through in the westbound direction (toward Fenimore Road). During the Peak PM Hour, there appears to be less vehicles currently cutting through the neighborhood eastbound while there is a similar amount of vehicles cutting through in the westbound direction today compared to 2001.

A review of the existing traffic volumes indicates that a large amount of drivers, close to 200 in the Peak AM Hour alone, utilize Plaza Avenue to Washington Street to reach Old White Plains Road, avoiding Mamaroneck Avenue. Between 350 and 400 vehicles use Waverly Avenue in the Peak AM Hour to reach northbound Mamaroneck Avenue, significantly more than are using Hoyt Avenue. To reach the train station and southbound Mamaroneck Avenue, more vehicles use Hoyt Avenue.

Drivers from the south on Mamaroneck Avenue are using Center Avenue to cut through the neighborhood. Over 200 cars are making this maneuver during the Peak Hours. Drivers from the north and the east are using Grand Street, Madison Street and Center Avenue, but this is to a lesser extent.

The impacts of the nearby schools were observed. While there was an increase in vehicular trips and pedestrians at those times, this was not significant and the schools did not have the major impact that they would have if the school was actually in the neighborhood. School buses turning left from eastbound Old White Plains Road have difficulty making the turn and will sometimes hold up traffic.

#### Existing Levels of Service

Level of Service Capacity Analyses were condition for the Peak AM Hour and the Peak PM Hour at each of the Study Intersections. A detailed description of Levels of Service

is contained in Appendix A. Level of Service Tables for each intersection by intersection approach are attached. Copies of the capacity analyses are contained in Appendix B.

The Tables summarize the Levels of Service for each of the Study Intersections. For signalized Levels of Service (LOS), the LOS is indicated in uppercase letters and is the overall LOS for the entire intersection. For unsignalized intersections, the LOS is indicated in lowercase letters and is the LOS for the intersection. The signalized intersections currently generally operate in the LOS B – C range. The unsignalized intersections generally operate in the LOS a – b range. The left turn/through movement from Waverly Avenue at Plaza Avenue is operating at a LOS e during the Peak AM Hour. It was experiencing similar delays in 2000. All other movements are operating at good levels of service. The intersection of Fenimore Road/Waverly Place operates better than it did in 2000. Because of the non-standard Stop sign configuration of the intersection of Fenimore Road/Hoyt Avenue, with Stop signs on two of the three approaches, the Capacity Analyses Software does not provide a Level of Service. With only the one Stop sign in 2000, the Hoyt Avenue approach was operating at a Level of Service f.

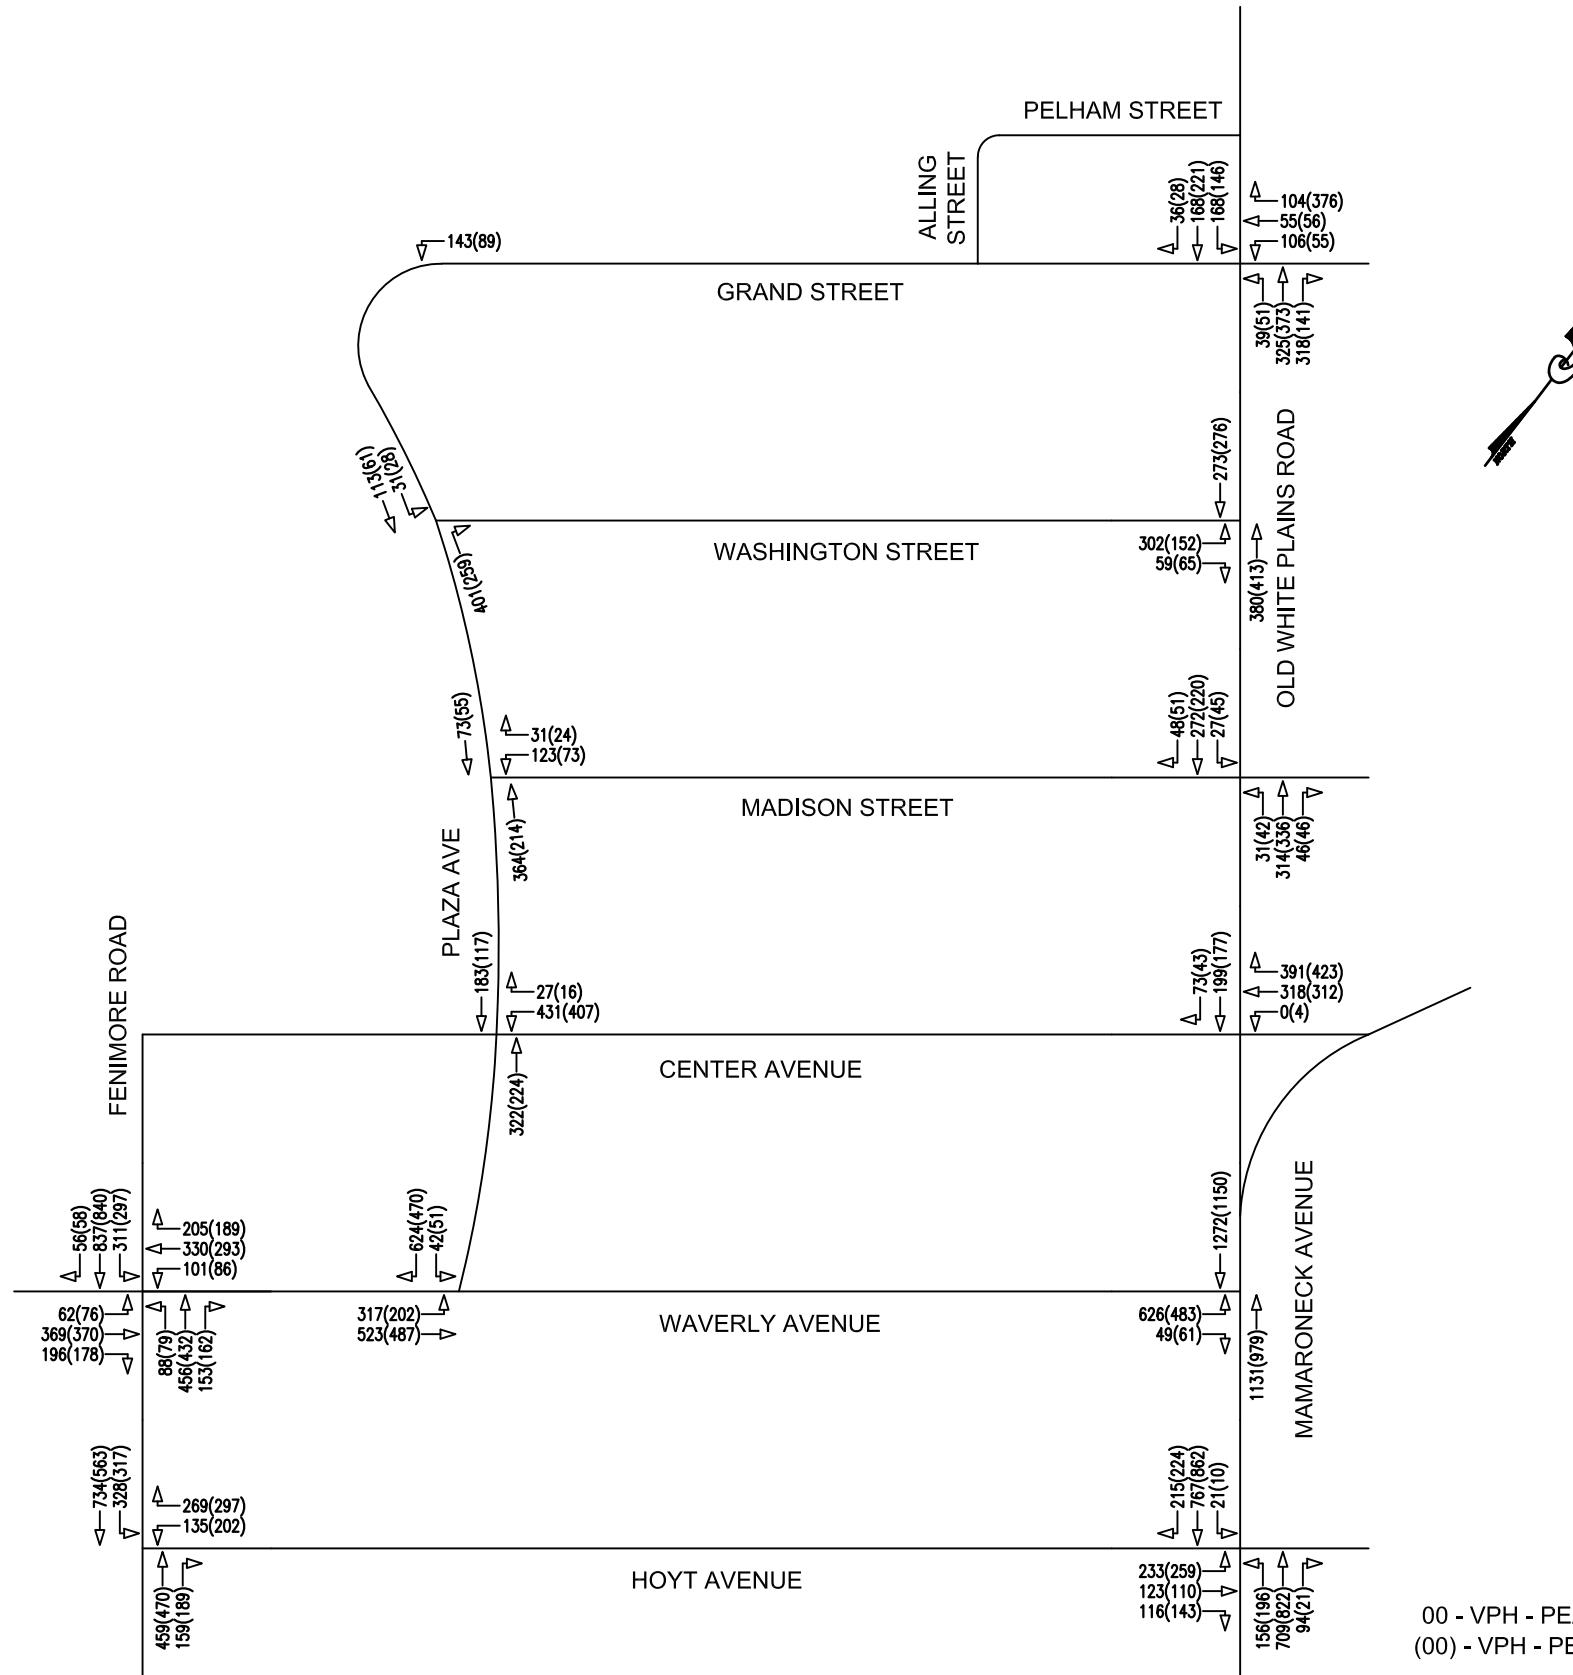

#### Future Traffic Volumes

The 2016 Existing Traffic Volumes were projected twenty years out to 2036 Future Traffic Volumes through the utilization of a compounded growth rate of 2% per year, which has been the default growth rate utilized in Traffic Studies in the area. However, this results in a total growth of almost 50% over the 2016 Existing Traffic Volumes. The resulting 2036 Future Traffic Volumes with the 2% per year growth are illustrated in Figure No. 3.

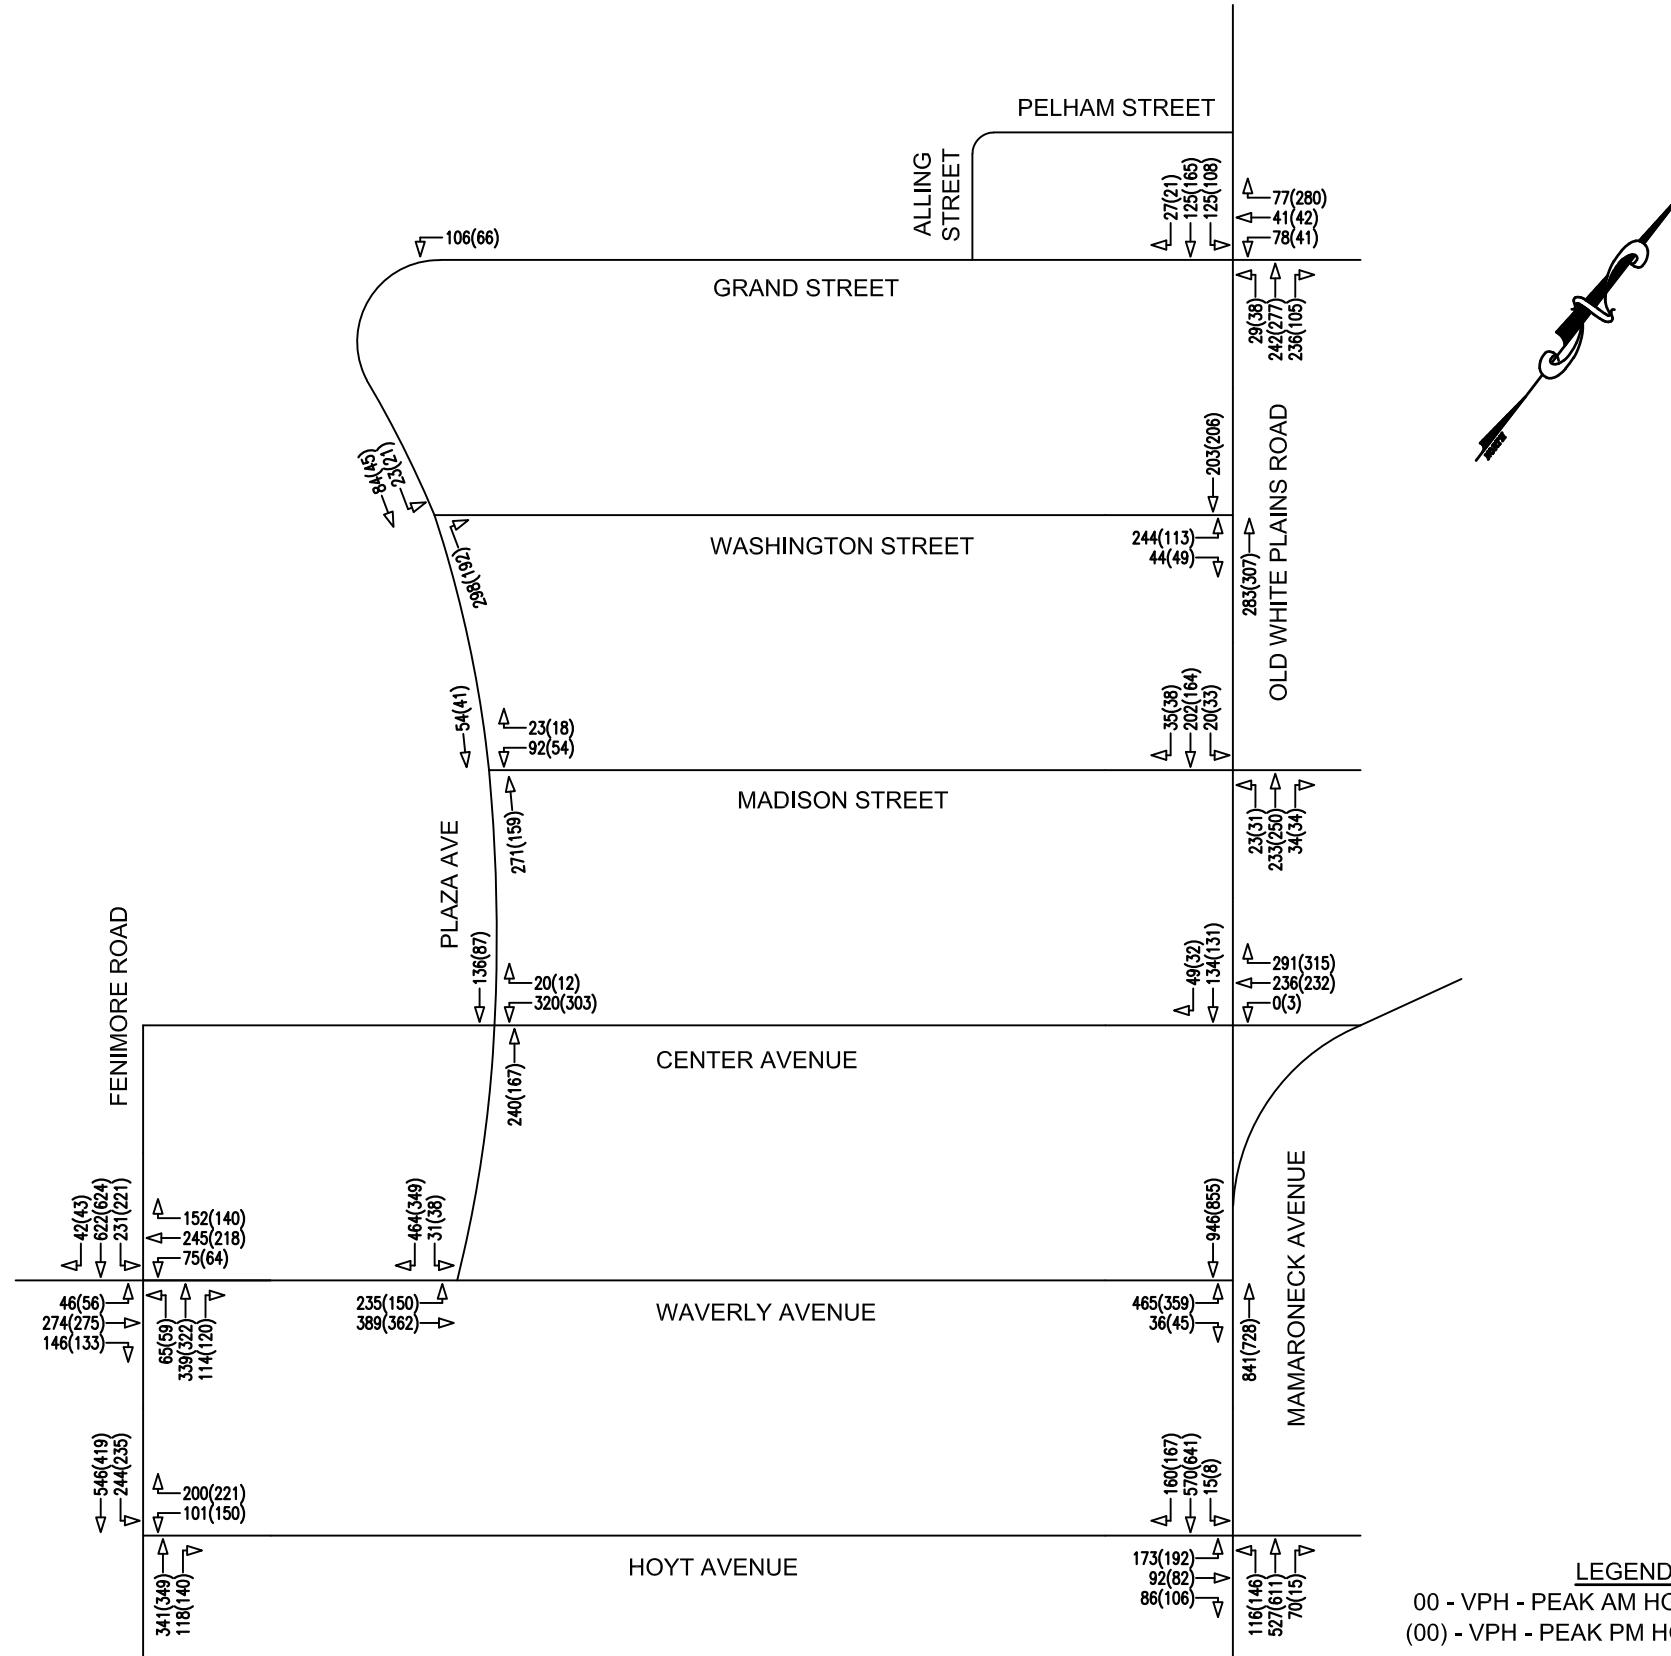

Traffic growth in the immediate neighborhood is projected to be small as there are limited open areas to build as well as limited area to accommodate additional parking. However, as overall traffic increases throughout the Village, there could be additional cut-thru traffic in the neighborhood. Thus, an additional projection utilizing a smaller growth rate of 0.5% per year was also utilized. These volumes are illustrated on Figure No. 4. A comparison of traffic volumes from 2001 to today more closely resemble the smaller growth rate.

#### Future Levels of Service

Capacity analyses were performed for the Study Intersections utilizing the 2036 Future Traffic Volumes at both the 2% per year compounded growth rate as well as at the 0.5% per year compounded rate. These analyses are summarized in the Tables and indicate that if the full 50% growth is experienced, some of the signalized intersections such as the intersection of Fenimore Road/Waverly Place will have certain intersection approaches operating at failing levels of service. While most of the neighborhood intersections that

2036 Future Traffic Volumes (2% Growth Rate)

 (00) - VPH - PEAK PM HOUR (4:45-5:45)

are unsignalized will continue to operate at good levels of service, the Old White Plains Road intersections and the intersection of Plaza Avenue/Waverly Avenue will have some movements operating at failing levels of service if the full growth in traffic is experienced.

At the smaller growth rate, the majority of the intersections would generally continue to operate at levels of service b or c.

### **3.0 PARKING CONDITIONS**

#### a. Existing Parking Conditions

PDE conducted numerous parking observations and parking counts on the roadways in the subject area during different times of the day and different days of the week. Physical parking counts were performed on the following dates and times while additional observations were performed at other times and on other dates:

Monday September 26, 2016	3:30 PM
Monday September 26, 2016	6:15 PM
Tuesday September 27, 2016	6:45 AM
Tuesday September 27, 2016	9:15 AM
Tuesday September 27, 2016	3:20 PM
Wednesday September 27, 2016	7:30 AM
Wednesday September 27, 2016	4:30 PM
Wednesday September 27, 2016	4:50 PM
Wednesday September 27, 2016	6:30 PM
Sunday October 16, 2016	12:15 PM
Sunday October 16, 2016	7:30 PM

A summary of the parking counts by street is attached. There are a total of approximately 158 on-street parking spaces in the neighborhood (excluding parking spaces on Pelham Street, Ailing Street, Old White Plains Road, Mamaroneck Avenue, and Hoyt Avenue). However this number is estimated and can vary depending upon where and how some people park, as the spaces are generally not striped. Thus, if a driver parking a vehicle leaves too much of a gap between cars, an additional parking space is lost and thus cannot be used.

The amount of vehicles parked in the neighborhood varied from 95 occupied parking spaces at 9:15 AM on Tuesday September 27<sup>th</sup> to 139 occupied parking spaces at 7:30 AM on Wednesday October 5<sup>th</sup>, which is to be expected as it is before most people leave for work and school. During these times, not all of the parking spaces were able to be utilized due to the gaps left between some cars as well as other reasons. For most streets, there were a few spaces open, but not necessarily that close to where certain residents live. Some streets were completely full at times.

There are various parking restrictions within the neighborhood including prohibition of commercial vehicles. The majority of the streets have two hour

Washingtonville Neighborhood Parking Summary										
Street	Parking Available <sup>1</sup>	Monday 9/26/2016 (3:30 PM)	Monday 9/26/2016 (6:15PM)	Tuesday 9/27/2016 (6:45AM)	Tuesday 9/27/2016 (9:15AM)	Tuesday 9/27/2016 (3:20PM)	Wednesday 10/5/16 (7:30AM)	Wednesday 10/5/16 (4:30PM)	Wednesday 10/5/16 (4:50PM)	Sunday 10/16/16 (12:15PM)

Total Demand <sup>4</sup>	158	101	112	95	107	139	103	114	136	120
										136

Notes:

1. Available parking may vary due to the size of different vehicles
2. Emergency vehicle had Waverly Avenue closed down during parking count
3. Sanitation Truck had Center Avenue closed during parking count
4. Total Parking only includes Washingtonville Neighborhood roads (Excludes Old White Plains Road, Mamaroneck Avenue, and Hoyt Avenue)

parking, but residents can park all day and night if they have a resident pass. This was established due to people previously parking in the area for the train.

There were people (possibly residents) parking in the non-residential/commercial lots.

#### Parking Signage

There is a significant number of parking related signs throughout the Washingtonville neighborhood. The majority of the signs are regulatory signs. Some of the signage prohibits the parking of commercial vehicles while others indicate no parking during certain times to allow for street cleaning. Many explain that there is 2 hour parking except for residents, a program established by the Village to eliminate people parking there who are using the train.

Many of the signs are old and faded or bent and should be updated.

## 4.0 **PEDESTRIAN AND BICYCLE CONDITIONS**

### Pedestrians

As described previously, there are sidewalks on the neighborhood streets. In most of the area, sidewalks are provided on both sides of the streets. Some are narrow and have utility poles and signage but they are generally serviceable. There are limited striped crosswalks in the area including at the day care center (see below) and across Old White Plains Road.

Because many residents live on the opposite side of the road from where they park their car on the street, people are crossing the various roads at all different locations.

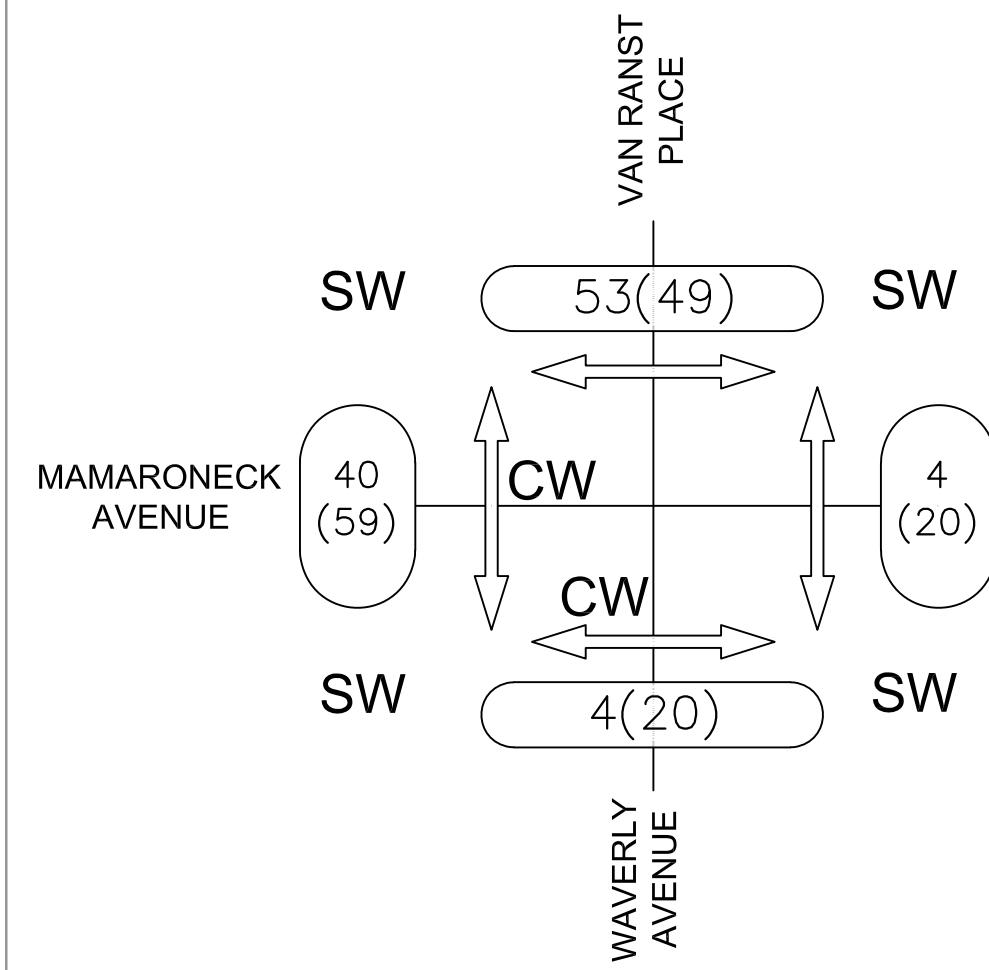

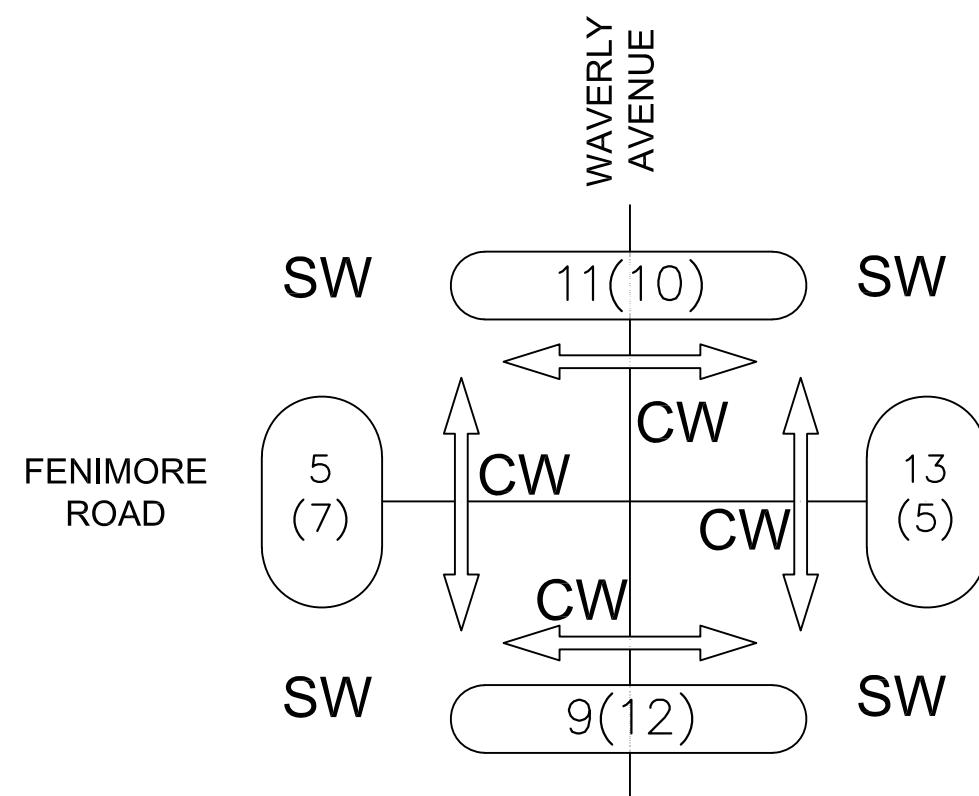

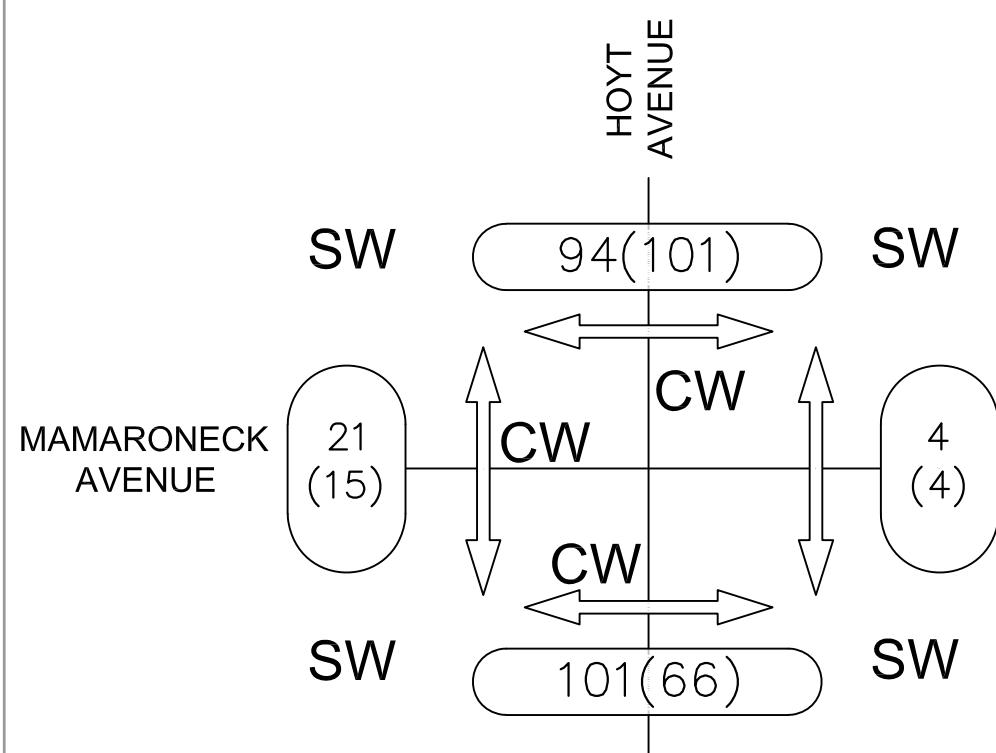

Many pedestrians on Mamaroneck Avenue and Old White Plains Road don't use the crosswalks or follow standard crossing procedures. While some cross at the intersection in conjunction with the traffic signal, others jay walk and cross in between intersections, especially on Old White Plains Road. Many of these appeared to be going to/coming from school while others were going to commercial facilities.

Figure No. 5 shows the number of pedestrians observed at the signalized intersections. There are a significant number of pedestrians at the intersections of Mamaroneck Avenue/Hoyt Avenue and Mamaroneck Avenue/Waverly Avenue. There are less pedestrians at the unsignalized intersections.

Pedestrians were also observed in the vicinity of some of the non-residential/commercial properties such as the day care and the Church. Some recommendations for the crosswalk at the day care facility on Center Avenue are discussed in Section 6.

### Bicyclists

There were very limited bicyclists observed in the neighborhood. A reason for this could be the narrow streets and the on-street parking.

#### LEGEND

00 - VPH - PEAK AM HOUR (7:30-8:30)  
 (00) - VPH - PEAK PM HOUR (4:45-5:45)

## **5.0 INTERSECTION OF FENIMORE ROAD AND HOYT AVENUE**

The operation of the intersection of Fenimore Road and Hoyt Avenue was also reviewed. The intersection is unsignalized and operates under an atypical control of Stop signs on two of the three approaches due to various factors. The westbound approach of Fenimore Road and the southbound approach of Hoyt Avenue currently have Stop signs. Thus, the eastbound approach of Fenimore Road does not have a Stop sign, which we were informed was due to the presence of the commercial driveway limiting where a Stop sign could be installed. The two approaches with Stop signs each have a supplemental sign indicating that the eastbound approach of Fenimore Road does not stop.

The reason for the current traffic control along westbound Fenimore Road is mainly a result of the existing railroad bridge over Fenimore Road, adjacent to the intersection. The bridge structure limits sight distance for vehicles exiting Hoyt Avenue.

Additional lighting can be added to the intersection, particularly the westbound approach, which will make the Stop sign more visible. Updating the Stop Ahead sign to current retroreflective standards will also make it more visible and is recommended. To further supplement the Stop sign's visibility, the word Stop could be written on the pavement and/or the small blinking LED lights could be added to the Stop sign. If it remains an issue, then flashing beacons could be added. An additional alternative would be to add a vertical red reflective strip along the sign pole. This is recommended.

The “2-Way” signs currently underneath the Stop signs at this location are no longer permitted by the Federal Manual on Uniform Traffic Control Devices (MUTCD) and thus should be removed.

One of the main goals of this Study is to reduce cut-thru's in the neighborhood. The amount of vehicles utilizing Hoyt Avenue currently is likely somewhat limited due to the lack of a traffic signal or a three-way stop at its intersection with Fenimore Road. Installing a traffic signal at this intersection would not be simple. If a traffic signal was to be installed at the intersection, it would be difficult to be seen by vehicles travelling westbound on Fenimore Road and additional measures would be required. Also, the location of Bishop Avenue would have to be taken into consideration, as well as the proximity to the existing traffic signal at Waverly Avenue.

It should be noted that even with a traffic signal installed, there would still be drivers cutting through the neighborhood unless other changes are made.

On Hoyt Avenue southbound, the signs should be modified to say “No Parking, Standing or Stopping” to prohibit trucks that are idling on Hoyt Avenue.

## **6.0 POTENTIAL MITIGATION/MODIFICATIONS**

*It is important to consider that any modification will have positive and negative impacts so one area or street may be improved at the expense of another area or street. Traffic will find an alternative route and that if you limit traffic in one spot, it will increase traffic in another. Also, any turn restrictions or traffic calming will not only impact the drivers cutting through the neighborhood but will also impact the residents, and thus a balance must be struck.*

The following is a summary of some of the mitigation/modifications that could be performed to improve the safety and/or efficiency through the neighborhood:

**Signage** – Additional signage could be installed in some locations but locations for the existing signs are generally appropriate. However, many signs are old/faded/dented and should be updated to current standards.

**Improved Geometry** – The intersection of Mamaroneck Avenue and Old White Plains Road is non-standard due to the angle of the intersection and the curve on Mamaroneck Avenue. In addition, Center Avenue intersects Old White Plains Road just prior to Mamaroneck Avenue. Drivers would make a short right turn and then a quick left turn, essentially going diagonally. Some modifications have been performed to improve the safety of the intersections and now there is a Stop sign as a driver exits southbound Mamaroneck Avenue onto White Plains Road as well as a Stop sign on Old White Plains Road just west of Center Street. Over 200 vehicles during each peak hour turn from Mamaroneck Avenue onto Center Street. Sight distance is limited due to the existing building on the corner and that is why the Stop signs were added. PDE reviewed various modifications at the intersection including the potential installation of a roundabout and had discussions with Westchester County (who has jurisdiction over Mamaroneck Avenue at this location). The traffic volumes along Mamaroneck Road, the close proximity of the traffic signal at Waverly Avenue, and the angle of Old White Plains Road make a roundabout and some of the other options unfeasible. Based upon a review of the intersections' operation and discussions with the County and consideration of the other factors, it has been determined to leave the intersections as is. However, a Yield bar should be added on Old White Plains Road before it merges with Mamaroneck Avenue. The addition of the Stop signs and the striping have improved the operation of the intersections. As discussed below, there has been some consideration of reversing the direction of traffic on Center Avenue.

**Recommended Parking Zones** – The implementation of the residential parking requirements, in conjunction with the other existing parking regulations, appears to be working appropriately. There is a significant amount of on-street parking occurring throughout the day, with the higher amounts overnight, as would be expected. Some

residents seem to also be parking in some of the non-residential/commercial properties at times. There are no real suitable locations within the neighborhood for additional recommended parking zones. Any redeveloped properties should provide some off-street parking.

Pedestrian Features – There are sidewalks on both sides of most of the roads. The sidewalks are generally narrow and some have utility poles in the middle of them and thus do not meet current standards but they are generally functional. Grand Street mainly only has sidewalks on the east side. The west side has limited room to install a sidewalk and there are utility poles. Plaza Avenue also has a sidewalk on only one side as there is a guiderail on the other. There is not a need for a sidewalk on that other side as there are no residences or destinations there. Hoyt Avenue also has a sidewalk on only one side also, as the other side contains a retaining wall for the railroad tracks.

There is a crosswalk along Center Avenue for the day care center. Additional signage should be added on both sides of the street at the crosswalk. Consideration should be given to slightly adjusting the location as there are no ADA ramps and there is a catch basin at one end of the crosswalk. There also should not be parking permitted all of the way up to the crosswalk as this limits the visibility of the pedestrians. Vehicles were observed parking right up to the edge of the crosswalk. This could result in the loss of a parking space.

Bicycle Features – The narrowness of the streets limits the ability of providing a separate bicycle lane, unless the existing on-street parking was removed.

Expanded Sidewalk Areas – There are very limited locations where sidewalk areas can be expanded to be of any significant benefit within the Washingtonville neighborhood. As previously described, the streets in the neighborhood have sidewalks on both sides except for Grand Street and Plaza Avenue, which both only have sidewalks on one side. Portions of Grand Street do have a sidewalk on the other side but the pieces are not connected. Because of the narrow width of Grand Street in conjunction with the utility poles and topography, it would be difficult to install a full-size regulation sidewalk for the entire length and still maintain the on-street parking.

There is not a need to install a sidewalk on the other side of Plaza Avenue as it would not serve a purpose.

One place where sidewalks could be widened and improved is the connection to and on the Waverly Avenue Bridge over the Sheldrake River. The bridge has two old, narrow asphalt sidewalks on each side that are not in the best condition. Because of the width of the bridge, full sidewalks cannot be installed on each side. There is the possibility of constructing a full sized sidewalk on one side of the bridge and eliminating the sidewalk

on the other side.

Sanitation Pick-Up – During periods of sanitation pick-up, some roads in the neighborhood are temporarily closed. This is an efficient procedure but it is recommended that the timing of the pick-up be adjusted to be outside the morning peak period and thus have it occur after 9:00 AM if possible.

Reversing One-Way Flow on Center Avenue - One possible traffic control modification to reduce cut-thru's is the reversal of the one-way pattern for Center Avenue from north-to-south to south-to-north. This would reduce traffic on cut-thru Center Avenue but it would increase traffic on Madison Street. Since it takes vehicles a little farther out of their way, it may slightly reduce cut-thru traffic in the neighborhood, but only in the one direction.

In the 2001 Study, an additional modification to this change would be the elimination of the left turn movement from Waverly Avenue. This would make it difficult to turn onto northbound Mamaroneck Avenue. Thus drivers would have to find alternative routes. It would reduce the number of cut-thru's but would result in inconveniences for the residents of the neighborhood. Some drivers, particularly Waverly Avenue residents, would then cut-thru the train station or use Halstead Avenue while the majority from the neighborhood would use Old White Plains Road and then cut-thru the neighborhood on the north side of Old White Plains Road to Grand Street, which also has previously expressed concerns about cut-thru's of their own. Cut-thru's would be reduced on Waverly Avenue and some on-street parking could be added in replace of the Waverly Avenue left-turn lane. If the left turns are not restricted on Waverly Avenue, then there would be the same cut-thru's on Waverly Avenue as there are today.

Reversing One-Way Flow on Center Avenue and Waverly Avenue – Traffic flow on Center Avenue currently runs east to west (away from Mamaroneck Avenue/Old White Plains Road) while traffic flow on Waverly Avenue currently runs west to east (towards Mamaroneck Avenue/Old White Plains Road). If the one-way flows on Center Avenue and Waverly Avenue are reversed, it would be difficult to reach northbound Mamaroneck Avenue. Reversing the travel directions on these roads would eliminate the ability to use the traffic signal at the intersection of Mamaroneck Avenue and Waverly Avenue to turn from the neighborhood onto northbound Mamaroneck Avenue. Thus drivers would have to find alternative routes. It would reduce the number of cut-thru's but would result in inconveniences for the residents of the neighborhood. Some drivers would then cut-thru the train station or use Halstead Avenue while the majority from the neighborhood would use Old White Plains Road and then cut-thru the neighborhood on the north side of Old White Plains Road to Grand Street. Waverly Avenue would still have a significant amount of cut-thru's, they would just be in the opposite direction.

Reversing One-Way Flow on Various Roadways – Aside from the above, reversing the one-way flow on other roadways would not have a significant impact but would generally just push the cut-thru's to a different neighborhood roadway.

Traffic Calming – Traffic Calming is another methodology that can be used to reduce cut-thru's in the neighborhood. These could include speed humps. Speeding is not really a major issue in the neighborhood based upon PDE's observations, particularly with the short, narrow roads and the on-street parking, but the speed humps could discourage some people from cutting through the neighborhood. However, speed humps can create noise, and can cause issues with drainage and snowplowing. In addition, the neighborhood residents would have to travel over them also. Locating the speed humps will take some effort to limit impacts of residents pulling in and out of their driveways while also not impacting on-street parking.

Reverse Parking Side – Reversing the side of the street that the on-street parking is on may help slightly increase the number of parking spaces on some of the individual streets. The impact of the shift would be a result of various factors including the number, size and the location of the various driveways as well as the location of the fire hydrants, among others.

Shifting Fire Hydrants – Some on-street parking spaces are lost due to the location of fire hydrants. Shifting fire hydrants to the other side of the street could slightly increase the number of parking spaces. However, this would be expensive, approximately \$10,000 per hydrant.

Chicaning of On-street Parking - One option is “Chicaning” the on-street parking, which would be continuously switching the side of the road that on-street parking is permitted as you travel the length of the road. Thus, for the first one hundred feet or so, the parking would be on the east side, then for the next one hundred feet, the parking would be on the west side, then it reverts back to the east side and continues on a similar pattern for the length of the street. This helps reduce cut-thru's and slows traffic, but would also result in the loss of some on-street parking for the cross-over areas and is effected by the location of the driveways. Thus this is not recommended.

Closure or Partial Closure of Waverly Avenue Bridge – A more drastic measure but one that would eliminate cut thru's would be the closure of the Waverly Avenue Bridge over the Sheldrake River. During the Peak AM Hour (7:30 – 8:30 AM), there are over 560 vehicles traveling eastbound over the bridge with another 420 traveling westbound. During the Peak PM Hour (4:45 – 5:45 PM), there are about 460 vehicles traveling eastbound and 315 traveling westbound. The Waverly Avenue Bridge is owned by the Town of Mamaroneck.

If the bridge is closed, drivers would not be able to directly travel through the Washingtonville Neighborhood to travel between Fenimore Road and Mamaroneck Avenue/Old White Plains Road. These drivers would need to find an alternative route, possibly Hoyt Avenue, Bishop Avenue or Palmer Avenue. This would add delays to the signalized intersections at those locations. In addition, the bridge closure would also impact the residents of the Washingtonville Neighborhood as they would no longer be able to use the bridge either and would be forced to loop around to get to or from the neighborhood. This would also add neighborhood traffic on some of the other streets in the neighborhood due to the one-way patterns.

A less drastic but still significant measure is a partial closure of the Waverly Avenue Bridge. This would only close the bridge in one direction, thus eliminating the cut-thru's in that direction. However, the impacts described above for the Washingtonville Neighborhood residents will still occur.

Discussions would need to be held regarding the need to continue to permit emergency service vehicles over the bridge.

Intersection of Waverly Avenue and Plaza Avenue – The intersection of Waverly Avenue and Plaza Avenue is non-standard due to the Waverly Avenue Bridge and the resulting offset at the intersection and thus it can be confusing for some drivers. Drivers travelling north on Waverly Avenue stop before the bridge and thus before they reach the intersection. Due to vegetation, the drivers have a limited view of traffic on Plaza Avenue. Both approaches do have stop signs facing them. The bridge is narrow and there is limited pedestrian areas on each side. The majority of traffic on Waverly Avenue stays straight on Waverly Avenue and then turns left at the traffic signal onto Mamaroneck Avenue, but over 200 vehicles during the Peak AM Hour turn west from Waverly Avenue onto Plaza Avenue and then turn onto Washington Street, with most of them then turning left onto Old White Plains Road. More than ninety percent of the Plaza Avenue traffic turns right and crosses the bridge. Some clearing of vegetation would help improve visibility and traffic flow.

Intersection of Hoyt Avenue and Fenimore Road – Mitigation for this intersection is described in the previous Section.

Truck Traffic – Trucks are currently restricted from using Waverly Avenue except for local deliveries and under set weight restrictions. Thus, trucks are supposed to use Hoyt Avenue. There are also issues with trucks hitting the railroad overpasses on Fenimore Road (10'2" Clearance) and Mamaroneck Avenue (10'11" Clearance). Additional signage including possibly with LED lights could be added. Bumper bars could also be added but with the location of the side streets and other curb cuts so close to the bridges, there may not be enough room for them to be installed to account for all trucks. "Low

Bridge” is painted on the roadway prior to the bridges and these are helpful but should be freshly painted.

Striping Plaza Avenue – A resident had asked the Village about providing a double yellow line on Plaza Avenue. However, due to the nature, traffic volume and width of the roadway, it is not necessary to stripe.

#### Preliminary Cost Estimates

Preliminary Cost Estimates can be further refined after the Village determines the route it chooses for these projects. Modifying signage and striping will be minimal costs. Relocating a fire hydrant would cost about \$10,000. Installing a traffic signal at the intersection of Fenimore Road and Hoyt Avenue would costs upwards of \$150,000.

**APPENDIX A**

**LEVEL OF SERVICE STANDARDS**

# **1. LEVEL OF SERVICE**

## **CONCEPT**

The 2010 Highway Capacity Manual, published by the Transportation Research Board of the U.S. Government, established a system by which highway facilities are examined for their adequacy to handle traffic volumes. The terminology "Level of Service" is used to provide a "qualitative" evaluation based on certain "quantitative" calculations which are related to empirical values.

Intersection Capacity, Delay and resultant Levels of Service are dependent upon a number of factors, including the following:

- Area Type
- Intersection geometrics
- Traffic volumes
- Parking conditions
- Pedestrian activity
- Vehicle Mix
- Bus Stop location and activity
- Peak Hour Factor
- Traffic Signal operation, if applicable

Ramp and weaving area Densities and resultant Levels of Service are dependent upon a number of factors, including the following:

- Number of lanes
- Configuration of weaving area
- Length of acceleration/deceleration lanes
- Vehicle speeds
- Traffic volumes
- Vehicle Mix
- Peak Hour Factor

## **FACTORS**

### **SIGNALIZED INTERSECTIONS**

Level of Service for Signalized Intersections is defined in terms of Delay, which is a measure of driver discomfort, frustration, fuel consumption, and loss of travel time. Specifically, Level of Service criteria are stated in terms of the Average Control Delay per vehicle for the peak 15-minute period within the hour analyzed.

Delay is a complex measure and is dependent upon a number of variables, including:

- Cycle length
- Ratio of Green time to Cycle length (G/C)

- Ratio of Volume to Capacity (V/C) for lane group or approach
- Traffic signal progression

### UNSIGNALIZED INTERSECTIONS

Level of Service for Unsignalized Intersections is also defined in terms of Delay. The amount of Delay is based upon the availability of "gaps" in the mainline traffic stream and the acceptance of these gaps by motorists waiting on the side street to enter the main street traffic flow.

### RAMP AND RAMP JUNCTIONS

Level of Service for ramp freeway junctions and the ramp proper are defined in terms of Density (passenger cars per mile per lane). Density is related to the traffic flow in the area of influence.

### WEAVING AREAS

Level of Service for weaving areas is defined in terms of Density (passenger cars per mile per lane). Density is based on the ratio of weaving vehicles to non-weaving vehicles and on vehicle speeds in the weaving area of influence

### CRITERIA

The criteria for the various Level of Service designations are as follows:

	<b>SIGNALIZED</b>	<b>UNSIGNALIZED</b>
<b>LEVEL OF SERVICE</b>	<b>Average Control Delay per Vehicle (Seconds)</b>	<b>Average Control Delay per Vehicle (Seconds)</b>
A	10.0 or less	10.0 or less
B	10.1 to 20.0	10.1 to 15.0
C	20.1 to 35.0	15.1 to 25.0
D	35.1 to 55.0	25.1 to 35.0
E	55.1 to 80.0	35.1 to 50.0
F	80.1 or greater	50.1 or greater

Level of Service	Ramp-Freeway Junction	Ramp Proper	Weaving Areas	
	Maximum Density pc/mi/ln	Density Range pc/mi/ln	Maximum Density pc/mi/ln	
			Freeway Weaving Area	Multi-lane + C-D Weaving Area
A	$\leq 10$	$\leq 11$	$\leq 10$	$\leq 12$
B	>10 - 20	>11 - 18	>10 - 20	>12 - 24
C	>20 - 28	>18 - 26	>20 - 28	>24 - 32
D	>28 - 35	>26 - 35	>28 - 35	>32 - 36
E	>35	>35 - 45	>35 - 43	>36 - 40
F	Demand exceeds capacity	>45	>43	>40

## **DESCRIPTION**

The following is a brief description of each of the six Level of Service designations as defined by the Highway Capacity Manual:

### **SIGNALIZED INTERSECTIONS**

#### **LEVEL OF SERVICE A**

Average Control Delay - 10.0 secs. or less

Describes operations with very low delay. Occurs when progression is extremely favorable and most vehicles arrive during the Green Phase and do not stop at all. Short cycle lengths may also contribute to low delay.

#### **LEVEL OF SERVICE B**

Average Control Delay - 10.1 to 20.0 secs.

Generally occurs with good progression and/or short cycle lengths. More vehicles stop than for Level of Service A, causing higher levels of average delay.

#### **LEVEL OF SERVICE C**

Average Control Delay - 20.1 to 35.0 secs.

Higher delays may result from fair progression and/or longer cycle lengths. Individual cycle failures may begin to appear at this Level of Service. The number of vehicles stopping is significant, although many still pass through the intersection without stopping.

## **LEVEL OF SERVICE D**

Average Control Delay - 35.1 to 55.0 secs.

The influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable progression, long cycle lengths, or high Volume/Capacity (V/C) Ratios. Many vehicles stop, and the proportion of vehicles not stopping declines. Individual cycle failures are noticeable.

## **LEVEL OF SERVICE E**

Average Control Delay - 55.1 to 80.0 secs.

The limit of acceptable delay.

Higher delay values generally indicate poor progression, long cycle lengths, and high V/C Ratios. Individual cycle failures are frequent occurrences.

## **LEVEL OF SERVICE F**

Average Control Delay - in excess of 80.0 secs.

Unacceptable to most drivers.

Occurs with oversaturation, i.e., arrival flow rates exceed the capacity of the intersection. May also occur at high V/C Ratios below 1.0 with many individual cycle failures. Poor progression and long cycle lengths may also be major contributing factors.

## UNSIGNALIZED INTERSECTIONS

### **LEVEL OF SERVICE A**

Average Control Delay - 10.0 secs. or less

Operations with little or no delay to minor turning movements.

### **LEVEL OF SERVICE B**

Average Control Delay - 10.1 to 15.0 secs.

Operations with short delays on minor turning movements.

### **LEVEL OF SERVICE C**

Average Control Delay - 15.1 to 25.0 secs.

Operations with average delays on minor turning movements.

### **LEVEL OF SERVICE D**

Average Control Delay - 25.1 to 35.0 secs.

Operations with some delays on minor turning movements.

## **LEVEL OF SERVICE E**

Average Control Delay - 35.1 to 50.0 secs.

Operations with long delays on minor turning movements.

## **LEVEL OF SERVICE F**

Average Control Delay - In excess of 50.0 secs.

Operations where demand exceeds capacity. Very long delays with queuing may be experienced on the minor street approach.

## RAMPS AND RAMP JUNCTIONS

### **LEVEL OF SERVICE A**

Maximum Density - 10 pc/mi/ln

Unrestricted operations with no noticeable turbulence in the ramp influence area.

### **LEVEL OF SERVICE B**

Maximum Density - 20 pc/mi/ln

Minimal levels of turbulence exist and speeds of vehicles in the influence area begin to decline.

### **LEVEL OF SERVICE C**

Maximum Density - 28 pc/mi/ln

Level of turbulence becomes noticeable as average speed within the influence area declines. Driving conditions are still relatively comfortable at this level.

### **LEVEL OF SERVICE D**

Maximum Density - 35 pc/mi/ln

Turbulence levels become intrusive. Queues may form on some high volume on-ramps but freeway operation remains stable.

### **LEVEL OF SERVICE E**

Maximum Density - >35 pc/mi/ln

Conditions approaching and reaching capacity. Speeds are reduced and turbulence of merging/diverging vehicles becomes intrusive to all vehicles in the influence area. Flow levels approach capacity limits and minor changes in demand can cause ramp and freeway queues to occur.

### **LEVEL OF SERVICE F**

Maximum Density – Demand flow exceeds limits

Unstable, or breakdown, operation. Approaching demand flows exceed the discharge capacity of the downstream freeway or ramp. Queues are visibly formed on the freeway and on-ramps and will continue to grow as long as the approaching demand exceeds the discharge capacity.
